

1.2 GHz OBI-Free ONU

LBON320ACT SERIES

LINDSAY
BROADBAND

Optical Beat Interference (OBI) occurs when simultaneous optical upstream transmissions from multiple CPEs (RFoG mini nodes) interfere with each other - a condition that becomes more likely as subscriber densities increase.

In efforts to eliminate the problem of OBI from RFoG FTTH networks, Lindsay offers the OBI-free LBON320ACT RFoG premise ONU device. The LBON320ACT provides OBI elimination in networks with multiple upstream lasers in passive optical splitter networks.

The LBON320ACT device eliminates OBI without compromising network performance and allows operators to deliver higher capacity DOCSIS® 3.0 and 3.1 technologies efficiently. The device provides groups of 8 stable upstream wavelengths, separated by 0.5 nm and thermally controlled to maintain its center wavelength over temperatures from -40°C to +60°C (-40°F to +140°F). The user can choose from 8 wavelengths from 1603.5 nm to 1616.5 nm via the interactive front panel on the ONU.

The LBON320ACT device uses an LED display to show the selected channel/wavelength of the ONU. The LED display will also show the optical receive input level in dBm. A pushbutton beside the display allows the user to select the desired wavelength. The LBON320ACT device supports 42/54 MHz, 65/85 MHz and 85/102 MHz frequency splits with the downstream frequency band out to 1218 MHz. The LBON320ACT device series comes standard with Automatic Gain Control (AGC) and burst-mode return lasers.
